RESTORATION

Roof systems can usually be restored – depending on the type of roof system that is currently installed on your building. Once restored, they can be warranted for up to 5 to 10 years. The most common roof systems used for restoration are Built-Up Roofs, and Single-Ply Roof Systems (EPDM and TPO).

EPDM RESTORATION

Ethylene Propylene Diene Monomer or Terpolymer is a product consisting of three distinct monomers. EPDM is classified as a Thermoset material,

which means it is either fully-cured prior to being installed, or that it cures during natural weathering after installation. EPDM roofs are single-ply membranes, with only one ply of roofing material, and not multiple laminated plies.

TPO RESTORATION

TPO membranes are single-ply roof membranes constructed from ethylene propylene rubber. They are designed to combine the durability

of rubber with the proven performance of hot-air weldable seams. They have excellent resistance to ozone, are algae-resistant, environmentally friendly, and safe to install.
